

REVENUE SNAPSHOT

For naturopathic clinics

This is a quick look at the money most clinics lose without ever seeing it - patients who quietly stop booking, and calls that never get answered. The numbers below are honest industry averages. It shows you what that costs, and what a simple system gets back for you.

1. What one patient is worth to you

One visit for a follow-up visit is about \$90 to \$250. But nobody comes just once.

Over a full year, one patient is worth about

\$350 - \$950

Across all the years they stay with you

\$1,400 - \$3,800

So losing one patient is not losing one visit. It is losing thousands.

2. What that costs you every year

Here is the math on a clinic about your size:

Your patient list, about

500

That go quiet each year (20%)

100 patients

Each one worth (over their life)

\$1,400

Future revenue walking out the door

\$140,000 / yr

3. The calls you never hear about

On top of that, about 23 to 27% of your calls go unanswered.

Small clinics miss a good share of their calls, and naturopathic care is mostly paid out of pocket. So every missed call is a booking that walks straight to another practitioner.

4. What we get back for you

We text your quiet list back in, in your name, and catch every missed call the moment it happens.

Of the 100 who left, we bring back about (17%)

17 patients

Each one worth (over their life)

\$1,400

Revenue we bring back to you

\$23,800

And we only ever bring back as many as your schedule can handle. This fills your calendar, it does not flood it. A fuller book, more of your people kept, and a clinic that quietly makes more - without you lifting a finger.

How the two systems work

Plain and simple, here is exactly what we set up for you.

Missed-Call Text-Back

When someone calls and you cannot pick up - you are with a patient, it is after hours, the front desk is buried - our system sees the missed call and sends them a text right away, in your clinic's name. Something like: "Hi, this is your clinic, sorry we missed you. How can we help?" They text back, and you have caught them before they call anyone else. It runs 24 hours a day, 7 days a week, on its own.

Why it works: about 85% of people who reach a voicemail never call back. They call the next clinic within minutes. A text lands different. Texts get opened 98% of the time, and 9 out of 10 are read within three minutes. So instead of losing that person, you are the first to reply.

Clinics that add missed-call text-back turn roughly 30% or more of their missed calls into booked appointments. People who would have been gone for good.

Patient Reactivation

You already have a list of patients who have not been in for a while. They are not upset, they just drifted off. Life got busy and nobody reminded them. We take that list and send a friendly text in your name, inviting them back in, and it books straight into your calendar. Their information never leaves your office, and there is almost nothing for your team to do.

Why it works: a text is personal and it gets read, where a letter or an email gets ignored. So a simple, well-timed message brings a real share of your quiet list back through the door.

A done-for-you reactivation campaign typically brings back 13 to 17% of your dormant patients. Money that was just sitting in your files.

What this means for your clinic

Put together, these two systems plug the two biggest leaks you have. You stop losing new callers to the clinic down the street, and you quietly win back the people you already earned once. That means a fuller schedule, steadier income, and more of your patients kept for the long run. All running in the background while you focus on care. We set it up, we manage it, and it is live within the week.
